Hydraulic Packings & Sealing Products

Issue 11

High Performance Sealing Technology

Hydraulic Packings & Sealing Products

Introduction

James Walker's highly-proven ranges of fluid sealing products and services are widely used in hydraulic applications around the world — from the heaviest forging and extrusion presses to the smallest actuators.

We back these products with top level technical expertise from dedicated industry specialists and highly efficient customer support operations.

The quality and longevity of our products are well appreciated by original equipment manufacturers and hydraulic plant operators, who rely on their efficiency to improve cost effectiveness and operational performance by helping to reduce plant downtime.

Your partner in sealing success

James Walker is a global manufacturer and distributor that supplies standard ranges and custom-designed sealing products to virtually every industrial sector. We help to keep plant and equipment running safely, efficiently and with improved environmental performance, year-in and year-out.

We have a worldwide family of companies with over 50 production, engineering, distribution and customer support sites spread across the Americas, Europe, Australasia, Asia Pacific and Africa.

At a local level, a close-knit network of James Walker companies and official distributors supplies our products and services to well over 100 countries. Our worldwide IT systems and logistics operations give customers the surety of supply they need.

James Walker Mfg. Co.

Our Glenwood, Illinois, manufacturing plant is a self contained unit that manufactures a full range of molded seals in NBR, HNBR and fluoroelastomers — both homogenous and textile reinforced — as well as other materials as required.

With some innovative molding techniques we have been able to manufacture endless fully molded rings up to 14ft diameter.

The plant focuses on the production of standard and custom designs for high pressures, large diameters, inch and metric sizes, exotic fluids, and other specialized applications.

Our unique prototype mold facility gives one-off and short-run molding capabilities without the high capital cost associated with conventional tools. These short-run mold tools are AutoCAD® designed and produced in-house.

Quality systems

At James Walker Mfg Co, our quality systems are third party registered to ISO 9001, the international standard that covers design, manufacture and supply.

For manufacturing, we source the best raw materials and use advanced processes with strict quality control and traceability at every stage. This culminates in an exacting inspection procedure for the finished product. Our stockholding and distribution also meet exacting standards.

Trademark acknowledgements

James Walker acknowledges the following trademarks as mentioned in this document. All other names bearing the ® symbol are registered trademarks of James Walker.

General information

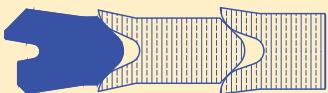

Health warning: If PTFE or fluoroelastomer (eg, FKM, FFKM, FEP) products are heated to elevated temperatures, fumes will be produced which may give unpleasant effects, if inhaled. Whilst some fumes are emitted below 480°F (250°C) from fluoroelastomers or below 570°F (300°C) from PTFE, the effect at these temperatures is negligible. Care should be taken to avoid contaminating tobacco with particles of PTFE or fluoroelastomer, or with PTFE dispersion, which may remain on hands or clothing. Material Safety Data Sheets (MSDS) are available on request.

Information in this publication and otherwise supplied to users is based on our general experience and is given in good faith, but because of factors which are outside our knowledge and control and affect the use of products, no warranty is given or is to be implied with respect to such information. Unless governed by type approval or contract, specifications are subject to change without notice. Statements of operating limits quoted in this publication are not an indication that these values can be applied simultaneously.

To ensure you are working with the very latest product specifications, please consult the relevant section in the James Walker website: www.jameswalker.com.

Quick reference guide

Lofilm® HD Packing
For rods/rams

For heavy forging & extrusion presses
Max working pressure: 9000psi (standard)
Maximum stroke speed: 100fpm
Temperature range: -4°F to +250°F
Supplied: Split or Endless

[More details: pages 4 - 5](#)

Lion® Expanding Packing
For rods/rams

Traditional heavy-duty multi-lip packing
Max working pressure: 9000psi (standard)
Maximum stroke speed: 100fpm
Temperature range: -4°F to +212°F
Supplied: Split or Endless

[More details: pages 6 - 7](#)

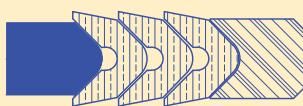

Lofilm Shallex® Packing
For rods/rams

Highly versatile multi-lip packing
Maximum working pressure: 6100psi
Maximum stroke speed: 100fpm
Temperature range: -4°F to +250°F
Supplied: Split or Endless

[More details: pages 8 - 11](#)

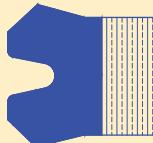

Shallex® Packing
For rods/rams

Universally proven multi-lip packing
Maximum working pressure: 6100psi
Maximum stroke speed: 100fpm
Temperature range: -4°F to +250°F
Supplied: Split or Endless

[More details: pages 12 - 18](#)

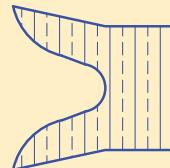

Solosele® G
For rods/rams & pistons

Robust single element seal
Maximum working pressure: 6100psi
Maximum stroke speed: 100fpm
Temp range: -4°F to +250°F (standard)
Supplied: Endless (Split can be supplied)

[More details: pages 19 - 20](#)

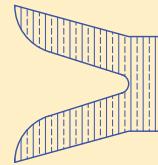

Lion® Glandsele
For rods/rams & pistons

U-packing for medium & heavy duty
Maximum working pressure: 5000psi
Maximum stroke speed: 100fpm
Temp range: -4°F to +250°C (standard)
Supplied: Endless

[More details: pages 21 - 22](#)

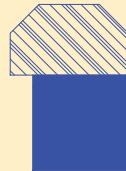

Lion® D/C Ring
For rods & pistons

U-seal for pneumatics & hydraulics
Maximum working pressure: 3000psi
Maximum stroke speed: 100fpm
Temp range: -4°F to +250°F (standard)
Supplied: Endless

[More details: pages 23 - 24](#)

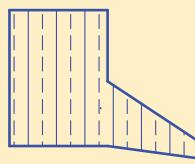

Lion® Composite Seals
For pistons & rods

Low friction with high performance
Maximum working pressure: 5800psi
Maximum stroke speed: 1000fpm
Temperature range: -13°F to +200°F
Supplied: Endless

[More details: pages 25 - 26](#)

Lion® Rod Wiper Type L
For rod wiping

Wiper for highly abrasive media
Temperature range: -4°F to +250°F
Supplied: Split or Endless
Robust and wear-resistant wiper of tough rubberised fabric construction.

[More details: page 27](#)

Lofilm® HD — rod/ram packing

For forging and extrusion presses, and other heavy-duty rod applications

- Max pressure: 9000psi (standard)
- Temperature range: -4°F to +250°F
- Max stroke speed: 100fpm (standard)
- Supplied: Split or Endless
- Robust rubberized fabric intermediate rings and gland rings with improved side-load capability
- Pressure responsive primary sealing ring of rubber
- Improved sealing on worn shafts.

Description

Lofilm® HD is a pressure-responsive hydraulic packing specifically for use in arduous reciprocating gland applications, where fast pressure rises occur and side loads can be substantial.

In these heavy-duty applications, the packing is often required to support the ram as well as maintaining a high-pressure seal. Support is particularly necessary when the ram is horizontal.

For many years, this ‘bearing’ role has been a feature of our Lion® Expanding Packing (see page 6), which has deep rings of robust construction that provide radial support to a large ram. Similar rings are now incorporated in our Lofilm HD.

Construction

Each Lofilm HD Packing set typically comprises intermediate rings and a gland ring (female adapter) of heavy-duty rubberized fabric, and an ‘odd-leg’ header ring (see Figure 1) of molded rubber.

Operational benefits

The molded rubber header is the principal sealing element of the set. Its initial radial interference reduces the fluid film to a minimum, which is a particular advantage on down-stroking operations where excessive leakage can be hazardous. This is also of great importance when auxiliary cylinders provide a rapid advance.

Usually, this means that the main ram is emerging under low-pressure conditions that lead to thick film formation or heavy leakage with conventional packings.

An annular groove is incorporated in the header of Lofilm HD to increase its response to applied pressure.

Furthermore, its ported ‘odd-leg’ design allows the gland loading to be transferred through the set to retain the main bushing — which is often not fixed — while also allowing system pressure to act on the annular groove.

The rubber sealing lips also conform more readily to an uneven surface, improving sealing integrity on worn shafts.

On equipment with rapid advance mechanisms and pre-fill valves, Lofilm HD prevents air being drawn into the system. This helps avoid uncontrollable movements of the main ram and severe cavitation damage to the seal and other components.

Lofilm HD occupies less space than other heavy-duty packings, which means that longer bushes can be used to reduce side-loads and prolong seal life. If it is impractical to fit new bushings when installing Lofilm HD, we can supply metal or composite spacer rings to adjust the housing depth, as this packing set must be fitted in an adjustable housing.

Design considerations: new projects

The limits, fits and surface finishes stated are a general guide, when manufacturing and reconditioning equipment, to achieve good sealing performance (see Figure 2). We acknowledge that acceptable results may be obtained with values outside those stated.

Diameters of ram to main bushing

should be as close to nominal as possible, with clearances on bushings or piston heads giving an H9/e8 fit (ANSI B4.i.1967 RC-5).

Control of extrusion clearances between the gland follower and ram is most important. The gap between the ram and inside of the gland plate must be as small as possible, but NOT smaller than guidance fit allows. Also insure a very close fit between the outside of the gland plate and housing bore.

Selection of tolerances must be influenced by any cylinder expansion at high pressure.

Finish of sliding surfaces with respect to the packing should be between 8 μ in and 16 μ in Ra, and the static surfaces 32 μ in Ra or better.

Housing chamfers aid assembly and prevent damage to sealing lips. The chamfer should be 20° to 30° to the ram, and the following lengths (Table 1):

Nominal radial section	inch	3/4	7/8	1	1 1/4
mm	20	-	25	30	
Minimum chamfer length	inch	3/8	3/8	3/8	1/2
mm	10	-	10	12.5	

Table 1

Lofilm® HD — rod/ram packing

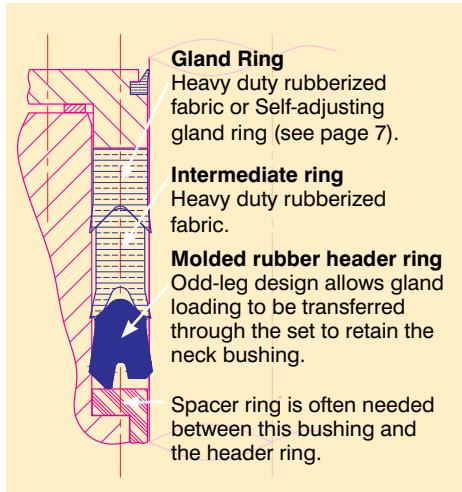

Figure 1: Arrangement

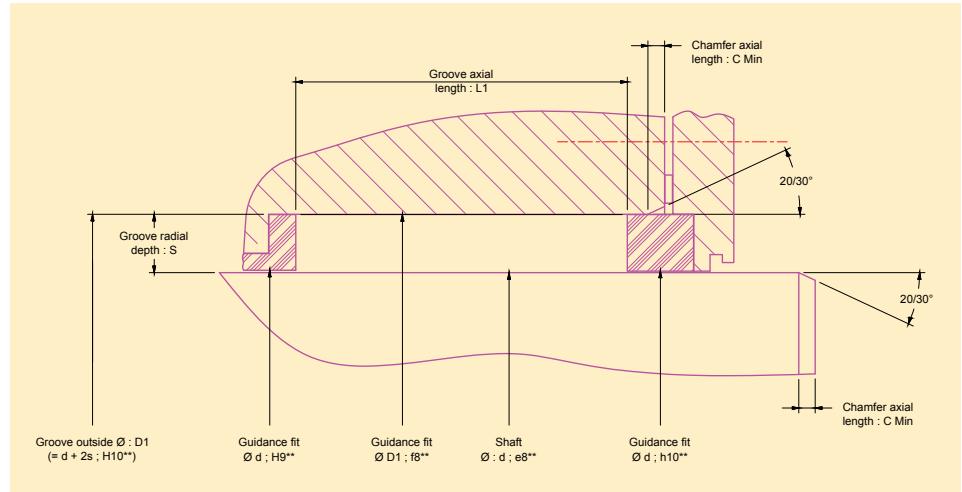

Figure 2: Housing diagram

Sections, diameters and depths for new designs are shown in Table 2. Special sets can be designed for existing equipment where modifications are not possible.

Ram diameter		Radial section	Housing depth
Above	Up to & incl.		
Inch			
19 5/8	48	7/8	4 1/2
48	-	1	5 1/2
mm			
500	1000	25	112.5
1000	-	30	135

Table 2

Where existing housings are deeper than those indicated in Table 2, we recommend our metal or composite spacer rings to adjust the housing to its correct depth. These are designed as a tight fit in the housing bore and have a wide clearance on the inside diameter to facilitate pressure transfer. They MUST be fitted on the pressure side of the packing (see Figure 1).

Axial compression: An important aspect of Lofilm® HD is that it must be very slightly compressed, or nipped, in the housing so that the main bushings are retained. This reduces the risk of damage to the seals by axial movement of these bushes as they follow the ram, especially on large horizontal presses.

To attain the correct compression, it may be necessary to insert shims under the gland plate. We supply shims on request.

Ordering Lofilm® HD Packing

Please contact us and state seal size and/or housing dimensions.

Our standard materials are intended for service with hydraulic oils and water-based hydraulic fluids at pressures up to 9000psi. To ensure compatibility with the fluid used on any specific application, please advise us of the manufacturer and designation of the fluid.

Sets will normally be supplied in a split format, where the Lofilm HD header has a unique bird-lip split (see Figure 3) which insures the integrity of the seal at the cut. (Bird-lip split MUST be cut at our plant).

Where endless sets are required, these can be supplied with an endless header, and split or endless intermediate rings and gland ring.

Figure 3: Bird-lip split

Lion® Expanding — rod/ram packing

Traditional heavy multi-lip packing for large presses and reciprocating pumps

- Max pressure: 9000psi (standard)
- Temperature range: -4°F to +212°F
- Max stroke speed: 100fpm (standard)
- Supplied: Split or Endless
- Withstands heavy side loads and high pressure peaks.

Description

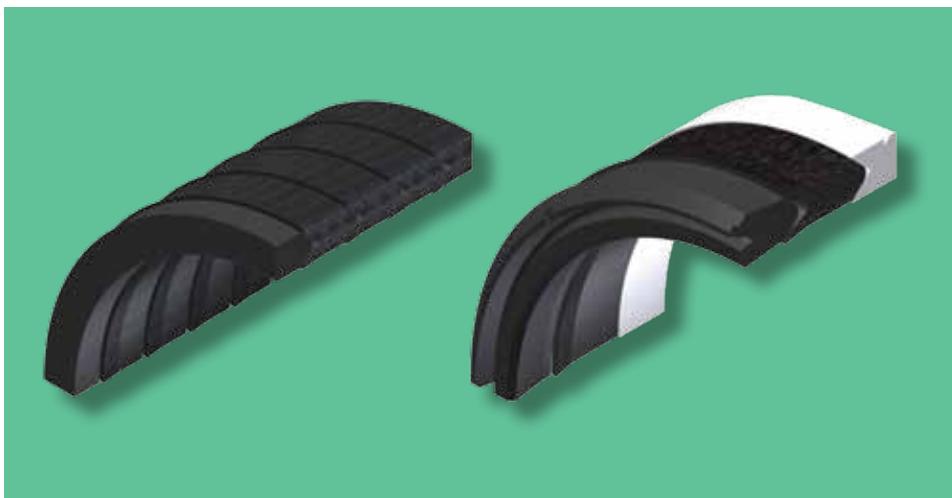

Lion® Expanding Packing is a heavy-duty design that has been in service worldwide on severe applications for many years. The profile of the sealing lips is especially suited to applications where heavy side loads and high pressure peaks are encountered on equipment such as forging presses.

Construction

Each packing set comprises a gland ring, two or more intermediate rings, and a non-sealing header ring. The sealing rings have double lips. Figure 4 shows a typical set.

A 'V' shaped base on the header and intermediate rings insures that this robust packing responds automatically to system pressure. The base shapes also give a wedging action under gland compression that can keep equipment in service — even with worn bushes or rams.

The sealing rings are molded with an interference fit on the lips to give an effective seal at low pressure, which is augmented by the system pressure when applied. The gland ring is manufactured with a heavily reinforced base to resist extrusion.

In order to resist distortion when under heavy side loads, and to withstand high pressure peaks, the individual rings are much more robust than those in a normal 'V' packing.

Design considerations: new assemblies

The recommended limits, fits and surface finishes are the same as for our Lofilm® HD packing (see pages 4-5).

The use of spacers or shims between the gland plate and cylinder is recommended to insure even compression of the packing, and to prevent 'hammering' of the gland plate under fluctuating pressure conditions.

Recommended sections, diameters and depths for new designs are shown below.

Figure 4: typical packing set

Ram diameter (inch)		Section (inch)	Pressure range				
Above	Up to & including		Up to 5000psi		Above 5000psi and up to 9500psi		
			Number of intermediate rings	Set depth (inch)	Number of intermediate rings	Set depth (inch)	
12	18	3/4	2	4 1/2	3	5 1/2	
18	24	7/8	2	5	3	6 3/8	
24	-	1	2	5 3/4	3	7 3/8	
Ram diameter (mm)		Section (mm)	Set depth (mm)	Set depth (mm)	Set depth (mm)		
300	600	20		115	3	148	
600	1200	25	2	145	3	183	
1200	-	30	2	175	3	224	

Recommended sections, diameters and depths for new designs

Lion® Expanding — rod/ram packing

Availability

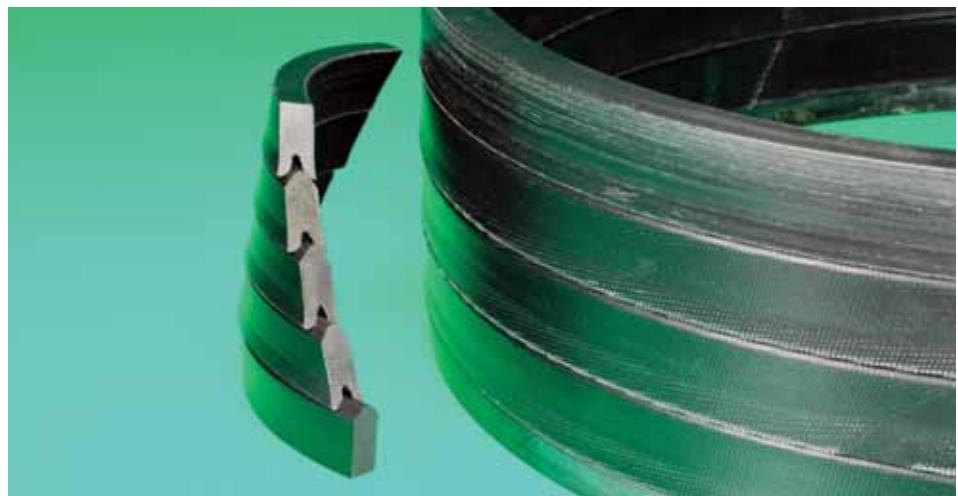

Split packing sets to suit the following nominal housing sections are readily available from stock without mold charges for the specified diameter ranges.

Cross section	Ram diameter	
	Above	Up to & incl
	inch	
3/4	20	40
7/8	30	44
1	30	56
1 1/8	38	56
	mm	
25	750	1400

Standard material for the gland ring and sealing rings is cotton fabric impregnated with a tough synthetic rubber.

Ordering Lion® Expanding Packing

Please contact us and state the type of fluid being used, the working temperature range, and the relevant ram and stuffing box dimensions.

Lion® Expanding Packing

Self-aligning Gland Ring

Description

Our Self-aligning Gland Ring is designed for use with heavy-duty packings where conditions are particularly arduous.

Each set comprises two triangular section rings of wear-resistant engineering thermoplastic. Under system pressure these slide apart from each other in a controlled manner to absorb wear and offset in the system.

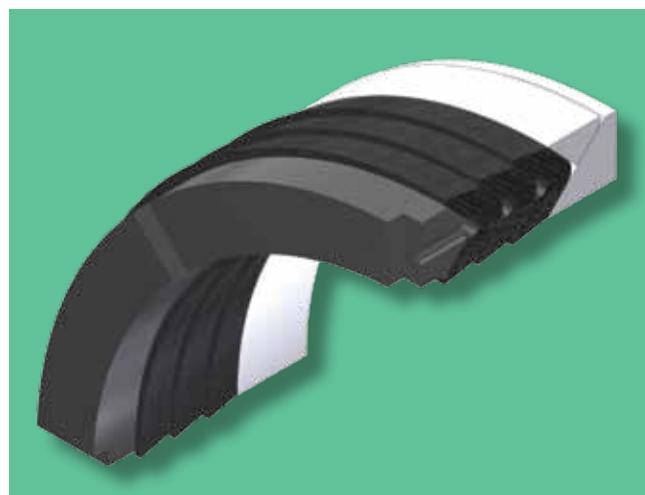

Typical applications

These are available as an optional extra with our following hydraulic packings:

- Lofilm® HD Packing (pages 4-5)
- Lion® Expanding Packing (pages 6-7)
- Lofilm Shallex® Packing (pages 8-11)
- Shallex® Packing (pages 12-18).

They are recommended for plants with:

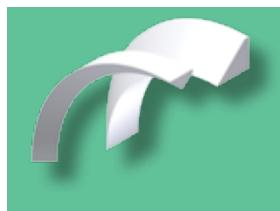

- Heavily worn rams
- Large degrees of shaft off-set
- Large extrusion gaps between the gland follower and ram.

Shallex® Packing with Self-aligning Gland Ring

For Pistons

For Shafts

Availability

Each set is designed to suit an individual application. Please contact us for further information.

Lofilm Shallex® — rod/ram packing

Combines a traditional robust multi-lip proofed fabric seal, with the film-wiping ability of a profiled rubber header

- Max pressure: 6100psi (standard)
- Temperature range: -4°F to +250°C.
- Max stroke speed: 100fpm (standard)
 - higher speeds possible for short periods
- Supplied: Split or Endless
- Reduces the fluid film to a minimum.
- Split design offers reduced downtime and excellent performance at high and low pressure.

Description

As its name suggests, our Lofilm Shallex® Packing for rods and glands operates reliably for very long periods with the absolute minimum thickness of stable fluid film on the dynamic contact surfaces.

This product comprises a robust gland ring/female adapter plus one or more V-shaped intermediate rings, and a header ring that is an interference fit on the housing width.

With its 'dry' running characteristics, this high-performance packing is ideal for virtually any type of hydraulic press (main rams and drawback rams), hydraulic cylinder glands, single-acting piston heads, and hydraulic valves. It is suitable for applications with mineral-based fluids.

Construction — standard

Header ring: abrasion-resistant medium nitrile (NBR) rubber.

Intermediate ring/s: cotton fabric proofed with a blend of synthetic rubbers.

Gland ring: cotton fabric proofed with a blend of synthetic rubbers. Self-aligning Glands Rings are available (see page 7).

Solid seals: when endless seals are specified, the fabric and rubber rings are supplied solid, and any support rings contain a single split.

Split seals: when split seals are specified the fabric rings are scarf split, the rubber header contains a bird-lip split (see page 5) and support rings are supplied in halves.

Non-specified: when split/endless is not specified, the rubber header will be supplied endless, but fabric gland and intermediate rings may be split.

Construction — non-standard

Working conditions exceeded those stated may be accommodated by material or set compensation. *Please consult our Technical Department.*

Where minimum packing friction is needed — eg, on gravity return multi-ram presses, or sensitive actuators — please consider our multi-lip Shallex® Packings or Composite Seal ranges.

Design considerations

Our recommendations for tolerances and surface finish will support requirements for good performance. These are for guidance only, as often reasonable performance will be achieved with values outside those stated. *If in doubt, please contact our Technical Department.*

ISO 5597/1 guidance on tolerances, extrusion gap, surface finish and lead-in chamfers, will suit most applications.

Tolerances: for optimum sealing, the diameters of rod/cylinder and housing, should be as close to nominal as possible. See ANSI B4.1 RC5 for typical tolerances.

Surface finish: surfaces with movement relative to the packing should have a finish of 8-16 μ in (0.2-0.4 μ m) Ra or CLA. On static surfaces a finish of 16-32 μ in (0.4-0.8 μ m) Ra or CLA is acceptable.

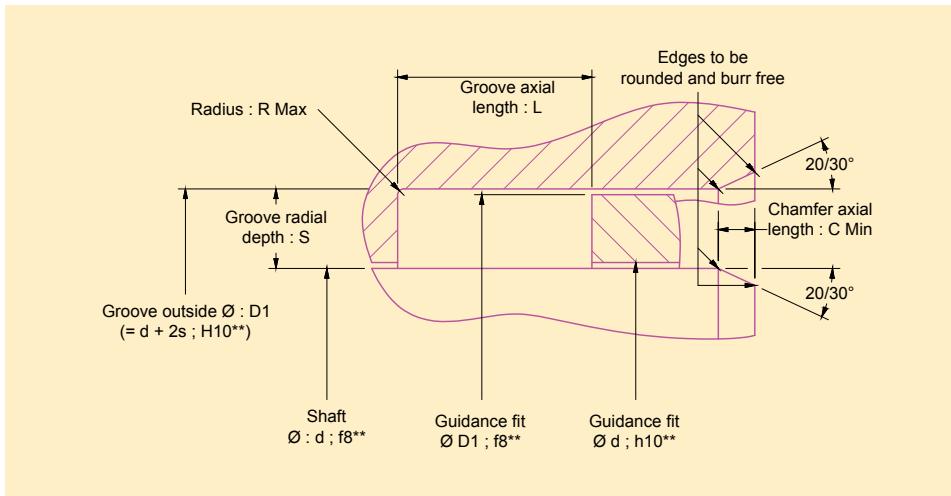

Standard ranges

Table 1 gives recommended housing section width and depth dimensions for inch and metric rod seal housings. The metric recommendations conform to ISO 5597/1. Maximum axial length L3 and the wider section width options are given as they are more suitable for plant with adverse mechanical conditions such as side thrust.

Table 2 details our standard range of Lofilm Shallex® to JW Chart 75 complying with ISO 5597/1 L3 wide.

JW Charts 830 & 831 (overleaf)

These charts will suit customers whose plant has existing seal housings for our conventional Shallex® Packings to JW Charts 430 and 431 (see pages 15-18), but would prefer the exceptional dry-running characteristics of Lofilm Shallex®.

The sizes in Charts 830 and 831 suit all housing dimensions covered by Charts 430 and 431.

The packing sets in Charts 830 and 831 are also suitable for pressures up to 6100psi. Please consult our Technical Department if higher pressures are involved.

- Chart 831 packing sets are suitable for pressures up to 6100 psi.
Where higher pressures are involved, please consult our Technical Department

Shallex® — rod/ram & piston packing

Universally proven multi-lip packing suitable for safety critical duties and adverse mechanical conditions

- Max pressure: 6100psi (standard)
- Temperature range: -4°F to +250°F with rubber-proofed fabric header, or +212°F with acetal header
- Max stroke speed: 100fpm (standard) — higher speeds possible for short periods
- Supplied Split or Endless
- Excellent extrusion and wear resistance.
- For adjustable and non-adjustable housings.
- Double-acting capability with back-to-back configuration.

Description

Shallex® is our universal multi-lip packing that is highly regarded for its long working life and ability to operate under adverse mechanical conditions. When used in split form it can provide major downtime savings.

This robust packing comprises a gland ring/female adapter, header/male adapter and one or more intermediate V-shaped rings. The rings are tapered to give an interference fit when confined in the seal housing. The resulting radial force, together with the fine finish of the lips, insures a good seal at low or slack pressures. A scarf abutment is used when the packing is supplied in split form.

In standard form, Shallex Packing is suitable for most types of hydraulic press (main rams and drawback rams), hydraulic cylinder glands and piston heads; hydraulic valves; and oil pipeline expansion glands.

When manufactured in special materials, this packing can work in reciprocating steam systems, water and oil pumps, hot oil reciprocating pumps, pumps for refinery duties up to +500°F, sludge pumps and swivels.

Construction — standard

Gland ring: cotton fabric proofed with a blend of synthetic rubbers. High performance acetal copolymer (up to 9.8in OD) and UHMW polyethylene are also supplied. Self-aligning Gland Rings of wear resistant thermoplastic are available (see page 7).

V-shape intermediate rings: cotton fabric proofed with synthetic rubbers.

Header: high performance acetal copolymer (available up to 9.8in OD), or UHMW polyethylene. For large diameters, cotton fabric proofed with a blend of synthetic rubbers can be supplied.

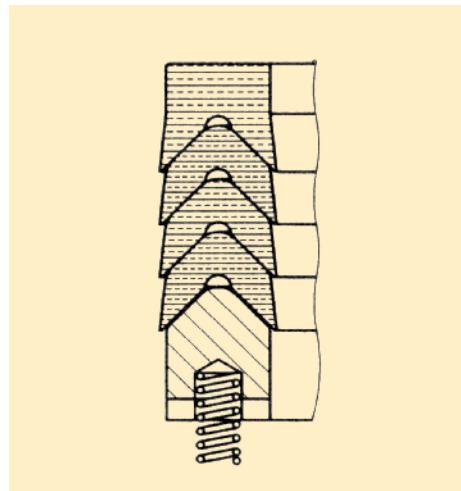

Standard materials are suitable for use with most mineral-based hydraulic fluids and lubricating oils, greases, water and air. The rubber blend we use has proved satisfactory with a number of fire-resistant fluids, including many phosphate ester and poliol ester types. *Where fire resistant fluids are used, it is essential that we be informed of type and designation.*

Construction — non standard

Alternative materials are available that extend considerably the packing's working temperature, fluid compatibility or wear resistance. These include aramid fabrics with proofing of butyl, fluorocarbon (eg, Viton®), and other elastomers. Where specified, sealing rings in homogeneous rubber or PTFE may be incorporated.

Spring-loaded header: this automatically compensates for wear, and supplements initial molded lip interference. It is recommended for use in fixed-depth housings when:

- The packing may be over-compressed.
- Housing is inaccessible for regular maintenance.
- Build-up to high pressure is rapid.
- Seepage occurs when a down-stroking press is non-operational — the springs provide a load to the sealing rings.

Shallex® with spring-loaded header

Shallex® — rod/ram & piston packing

Application considerations

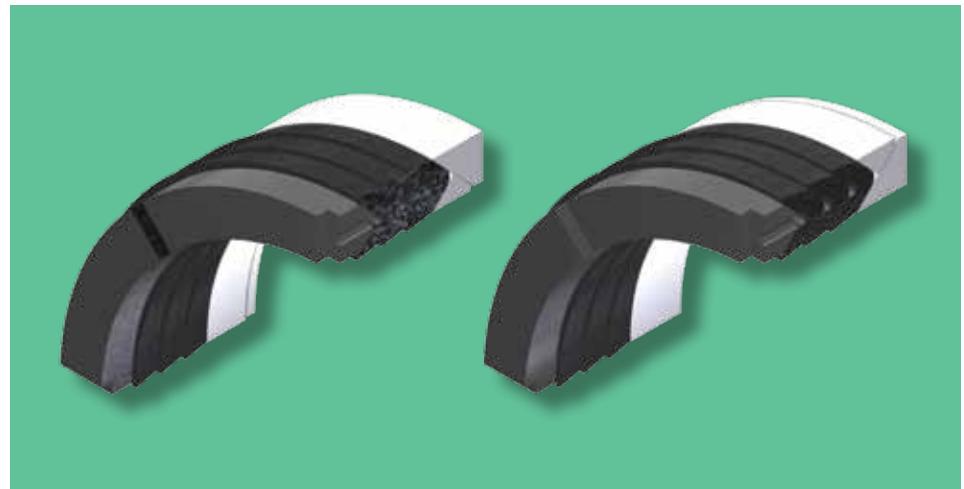

Non-adjustable housings: we need to be informed so that overall packing depth can be controlled and adequate compression is obtained. When ordering from our standard charts, the appropriate part number should be specified.

Non-adjustable housing depths should be equivalent to the normal set depth C (page 14) with the following limits applying:

Packing ID	Limits
Inch housings (inch)	
≤ 20	+0.01 / -0
> 20	+0.015 / -0
Metric housings (mm)	
≤ 500	+0.25 / -0
> 500	+0.40 / -0

Piston heads: we recommend that two Shallex® packing sets be used on double-acting pistons operating under constant pressure. These should be fitted in opposed mode, and independently housed to avoid undesirable pressure transference — see typical installation below.

Endless rings are always preferred for piston head assemblies, and this should be noted when placing inquiries or orders.

Design considerations

This information is for guidance only, as other considerations may affect the final decision. *If in doubt, please contact our Technical Department.*

Tolerances: for optimum sealing, the diameters shaft/cylinder and housing should be as close to nominal as possible, and adjacent fits kept to a minimum. ISO tolerance scale H8/f8 or ANSI B4.1 RC5 are ideal for most services.

Surface finish: surfaces with movement relative to the packing should have a finish of 8-16µin (0.2-0.4µm) Ra or CLA. On static surfaces a finish of 16-32µin (0.4-0.8µm) Ra or CLA is acceptable.

Assembly

Shallex Packing is entirely self-sealing and heavy gland compression is undesirable as it can reduce packing life.

Adequate chamfer should be provided at the entrance to all packing spaces to avoid lip damage on assembly.

How supplied

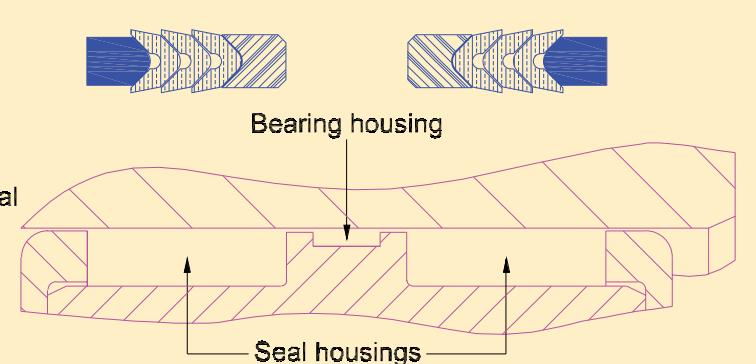

Shallex Packing sets are available in sections from 3/16in (5mm) upwards, except for spring-loaded versions where minimum section is 1/4in (6.5mm).

Split rings are supplied to any maximum diameter, and endless rings up to 88 1/2in (2250mm) OD. For non-standard sizes, sets may be supplied in split form at our discretion, unless endless packing rings are specifically requested when ordering.

See page 14 for recommended packing dimensions relating to shaft and cylinder dimensions and pressure.

When ordering please state:

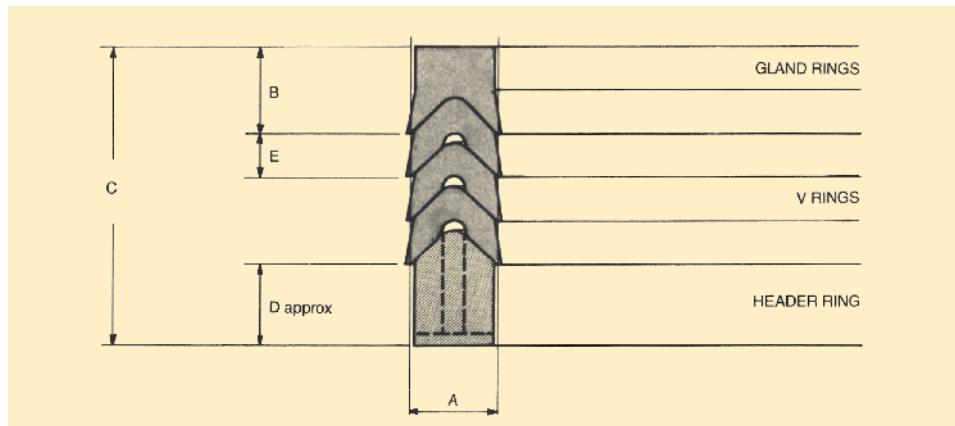

- Type of machine.
- Gland or piston head (for piston, state if cover plate is bolted or screwed)
- Exact diameters of ram and stuffing box.
- Length of gland lip.
- Adjustable or non-adjustable housing.
- Pressure medium.
- Pressure.
- Temperature.
- If application involves edible products.
- Whether ram is assisted on down-stroke, or falls by gravity.
- Whether endless or split rings required.

Shallex® — rod/ram & piston packing

JW Chart 430 — inch sizes

The JW Part Numbers specified indicate endless type packing rings. If split-type rings are required add **SPLIT** to the appropriate Part Number.

Total depth 'C' is expressed as a nominal dimension. All packings to our Standard Charts are supplied with the set depth accurately controlled so as to be equally suited to adjustable or non-adjustable housings.

All standard sizes detailed are supplied without mold charge. In addition, a wide range of molds exists for non-standard sizes.

All dimensions in inches

JW Chart 430

* Housing depth = C + 0.010in / -0

JW Chart 431

* Housing depth = C + 0.25mm / -0

Shallex® — rod/ram & piston packing

JW Chart 431 — metric sizes (mm)

The JW Part Numbers specified indicate endless type packing. If split rings are required add **SPLIT** to the appropriate Part Number.

Total depth 'C' is expressed as a nominal dimension. All packings to our Standard Charts are supplied with the set depth accurately controlled so as to be equally suited to adjustable or non-adjustable housings.

All standard sizes detailed are supplied without mold charge. In addition, a wide range of molds exists for non-standard sizes — including our alternative metric range for JW Chart 345.

Solosele® G — rod/ram & piston packing

Robust and compact seal for single ring duties on all hydraulic or pneumatic applications

- Max pressure: 6100psi (standard)
- Temperature range: -4°F to +250°F
- Max stroke speed: 100fpm
- Supplied: Endless
- Long life with zero seal maintenance
- Easy retrofit into existing grooves.

Description

Solosele® G is our primary recommendation for all single-ring hydraulic and pneumatic services — including the heaviest duty applications.

Its sealing area is manufactured from a specially-formulated rubber that resists virtually all known hydraulic fluids (except some phosphate esters). In addition, a fabric reinforced base is press vulcanized to the sealing portion, which eliminates the need for separate anti-extrusion rings.

Sealing geometry includes chamfered lips, and a fixed interference level that provided the lowest possible fluid film — even at slack pressures that are usually more difficult to seal than full hydraulic loads.

A major feature is the seal's float-fit in its housing, which offers many advantages:

- Easy retrofit into existing grooves.
- No adjustments — zero maintenance
- Low friction for gravity return without hang-up.

Solosele G is recommended for:

- Hydraulics and pneumatics to 6100psi.
- Upstroking presses, slab side or four poster — especially in rubber and thermoset compression molding.
- Hydraulic cylinder piston heads and rods.
- Hydraulic control valves and accumulators.
- Gravity return presses needing low friction characteristics.
- Older presses with scored rams, worn bushes or guides (sharp edges on scores must be smoothed).

Construction — standard

LR6364/NM59-74/80: an ideal material for most hydraulic and pneumatic services, such as press rams, hydraulic cylinders, valves, end caps and swivels. Also used on hydroelectric services including wicket gates, trunnion bearings and servo motors. Maximum temperature is 250°F.

Construction — non-standard

FR22/LR5781: Fluoroelastomer-based materials for high temperatures, phosphate esters and services requiring additional chemical/solvent resistance. Maximum temperature is 400°F.

EOL/FC/175: Elast-O-Lion® hydrogenated nitrile (HNBR) elastomer-coated fabric with very high abrasion resistance and excellent hydrocarbon resistance. Maximum temperature is 250°F.

Design considerations

Diameters: Diametral tolerances should be as close as possible to nominal. From the seal function point of view, ANSI B4.1 running clearance class RC6 (H9/e8) is recommended. Please note that other design considerations may affect the use of RC6. *If in doubt, please contact our Technical Department.*

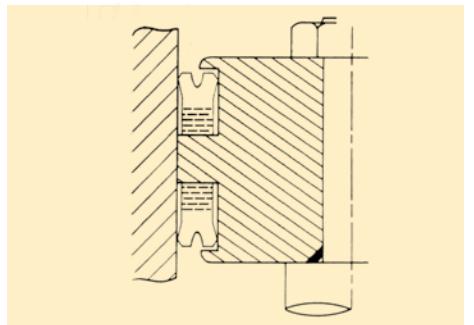

Housing depths: These seals must NOT be compressed axially. The housing depth must be at least 1/8" greater than seal depth to allow 'float'. Although there is no theoretical maximum housing depth, this should be close to minimum on severely scored rams, otherwise the seal may be dragged up and down in the housing. Filler rings are available for this purpose.

Single piece, spool-type pistons should have a retaining shoulder (see *diagrams in column three*) to provide a snap-in housing.

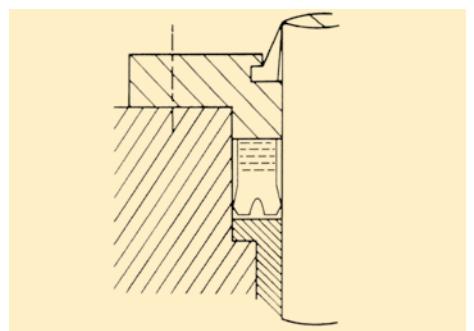

Surface finish: Surfaces with movement relative to the seal should have a finish of 8-16 μ in (0.2-0.4 μ m) Ra or CLA. On static surfaces a finish of 16-32 μ in (0.4-0.8 μ m) Ra or CLA is acceptable.

How supplied

Please see charts on page 20 and quote the JW Part Number. Alternatively, state seal size or housing dimensions. Please inform us of relevant application details.

Lion® Glandsele — rod/ram & piston packing

Medium to heavy duty U-packing for services requiring a single ring seal

- Max pressure: 5000psi (standard)
- Temperature range: -4°F to +250°F
- Max stroke speed: 100fpm
- Supplied: Endless
- Easy retrofit into existing grooves.

Description

Lion® Glandsele is a medium to heavy duty U-packing with a reinforced base, for services where a single ring seal is required.

This seal is designed to be a float-fit in its housing, which provides benefits such as minimal maintenance and low friction characteristics. It has a molded-in interference fit at the lip tips to provide an initial seal under low or slack pressure conditions, and a heavy base that acts as an anti-extrusion device for conditions involving worn bushings or rams.

With its symmetrical section, Lion Glandsele works with equal efficiency on rod/ram services (ID sealing) and piston heads (OD sealing). It is suitable for conventional rod housings with removable gland retainer plates, and most piston heads — including single-piece pistons.

A snap-in groove for the seal is a simple machining operation, although opposing seals in double-acting pistons need to be separated by a fixed metal plate to avoid undesirable pressure transference.

Lion Glandsele is recommended for:

- Hydraulics and pneumatics to 5000psi.
- Upstroking presses, slab side or four poster — especially in rubber and thermoset compression molding.
- Hydraulic cylinder piston heads and rods.
- Hydraulic control valves and accumulators.
- Gravity return presses needing low friction characteristics.
- Older presses with scored rams, worn bushes or guides (sharp edges on scores must be smoothed).

Construction — standard

Nitrile synthetic rubber with a fine weave fabric reinforcement. This is suitable for most hydraulic fluids including oil, water, water/soluble oil, water-glycol and many phosphate ester fluids. Maximum temperature is 250°F.

Construction — high temperature

Fluoroelastomer-based elastomer blend with textile reinforcement, developed for high temperature applications. Maximum constant temperature is 400°F.

Construction — non-standard

Elast-O-Lion® hydrogenated nitrile (HNBR) elastomer-coated fabric for improved oil and solvent resistance. Maximum temperature is 250°F.

Polyurethane: for cold water and warm oil services. Maximum continuous temperature is 175°F.

Design considerations

Diameters: Diametral tolerances should be as close as possible to nominal. From the seal function point of view, ANSI B4.1 running clearance class RC6 (H9/e8) is recommended. Please note that other design considerations may affect the use of RC6. *If in doubt, please contact our Technical Department.*

Housing depths: These seals must NOT be compressed axially. The housing depth must be at least 1/8" greater than seal depth to allow 'float'. Although there is no theoretical maximum housing depth, this should be close to minimum on severely scored rams, otherwise the seal may be dragged up and down in the housing. Filler rings are available for this purpose.

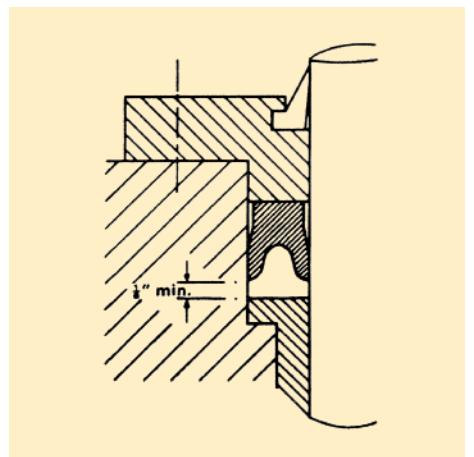

Single piece, spool-type pistons should have a retaining shoulder to provide a snap-in housing.

Surface finish: surfaces with movement relative to the seal should have a finish of 8-16 μ in (0.2-0.4 μ m) Ra or CLA. On static surfaces a finish of 16-32 μ in (0.4-0.8 μ m) Ra or CLA is acceptable.

How supplied

Please see charts on page 22 and quote the JW Part Number. Alternatively, state seal size or housing dimensions. Please inform us of relevant application details.

Note: higher pressures than 5000psi may need special designs. *Please consult our Technical Department.*

Lion® D/C Ring — rod/ram & piston packing

Light to medium duty U-packing for pneumatic and hydraulic cylinders or presses

- Max pressure: 3000psi continuous, plus spikes to 5000psi
- Temperature range: -4°F to +250°F
- Max stroke speed: 100fpm
- Supplied: Endless
- Over-square section avoids rolling in the housing groove.

Description

Our Lion® D/C Ring is a light to medium duty U-packing especially designed for pneumatic services in both cylinders and presses. A higher pressure version is supplied for hydraulic applications.

For pneumatic services, the D/C Ring is a soft, flexible yet hardwearing seal, with a wide flare at the lips for rapid response to low pressure air conditions.

In either form, pneumatic or hydraulic, the cross section of the seal is over-square — deeper than it is wide — which helps to prevent the seal from rolling in its housing groove. Seal rolling is a common fault with some 'square' seals, especially those made of homogeneous rubber.

The fabric reinforcement of our Lion D/C Ring further reduces the risk of rollover by avoiding the tendency of homogeneous rubber or urethane to 'stick' to a rod under low pressure conditions.

Lion D/C Rings are recommended for:

- Mechanical stamping and transfer presses, including clutches, brakes, die-cushions and counter balance cylinders.
- Pneumatic cylinder rods and pistons.
- Hydraulic cylinder rods and pistons up to 3000psi continuous pressure, with pressure spikes up to 5000psi.
(For higher pressures, please consult our Technical Department.)
- Hydraulic press rams in good condition.
(For presses with worn rams and bushings we recommend our Lion® Glandseal — see page 21).

Construction — standard

Nitrile synthetic rubbers with a fine weave fabric reinforcement. This is recommended for hydraulic and pneumatic services up to 250°F.

As well as the air in pneumatic services, it is also suitable for use with oil, water, and some fire resistant hydraulic fluids at up to 250°F.

Construction — non-standard

Elast-O-Lion® hydrogenated nitrile (HNBR) elastomer-coated fabric. This material is recommended for certain hot air conditions as well as hydraulic services at up to 250°F.

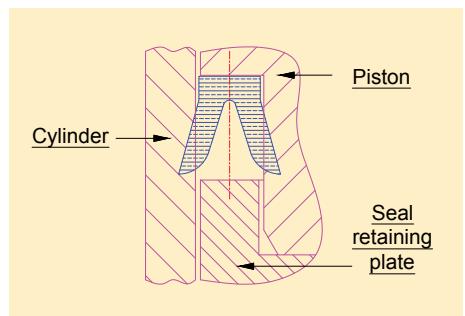

Design considerations

Groove design: Standard sizes are shown on the chart on page 24. For non-standard designs, please consult our Technical Department.

Diameters: Diametral tolerances should be as close as possible to nominal. From the seal function point of view, ANSI B4.1 running clearance class RC6 (H9/e8) is recommended. Please note that other design considerations may affect the use of RC6. If in doubt, please contact our Technical Department.

Housing depths: Lion D/C Rings are designed to operate with a 1/8" 'float' within the housing. If your housing does not conform to this requirement, please contact our Technical Department for recommendations.

Surface finish: Surfaces with movement relative to the seal should have a finish of 8-16 μ in (0.2-0.4 μ m) Ra or CLA. On static surfaces a finish of 16-32 μ in (0.4-0.8 μ m) Ra or CLA is acceptable.

Lion® Composite Seals — for pistons & rods

Running sleeve of PTFE, supported and energized by a rubber element

- Max pressure: 5800psi (standard)
- Temperature range: -13°F to +200°F
- Max stroke speed: 1000fpm
- Supplied: Endless
- 'Instant' response to pressure variations, with minimal leakage.
- Low dynamic and breakout friction for smooth operation and reduced power consumption.
- Extended sealing life.
- Compact design to suit simple recess grooves.

Description

Designed for use on both pneumatic and hydraulic services, Lion® Composite Seals combine the low friction characteristics of Fluolion® PTFE or high-performance Fluolion® Xtreme PTFE, with the energizing capability and static sealing efficiency of compressed rubber.

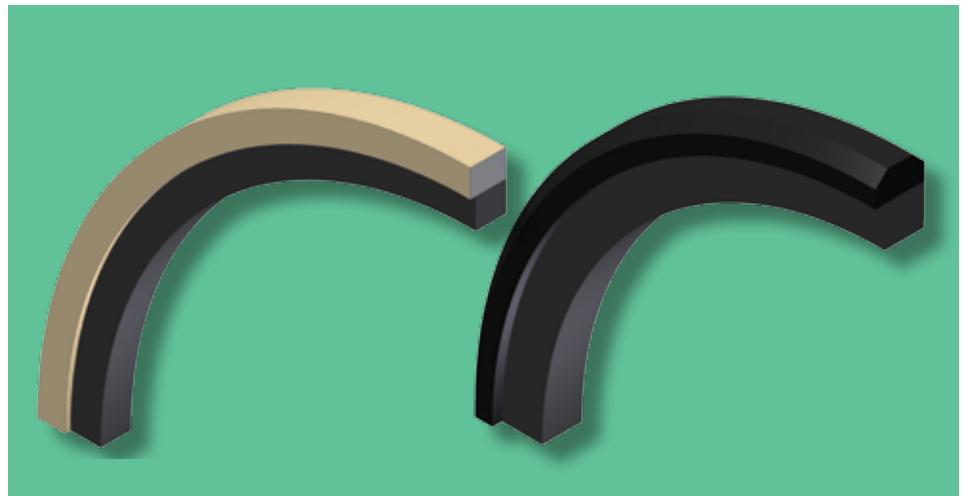

The energizer is designed to distribute an even load to the PTFE sealing element, to maximize the sealing efficiency of the system and to minimize leakage.

In operation, there is an intimate face-to-face contact between the PTFE sleeve and the cylinder or rod surface, and the sleeve is securely restrained to prevent it from rocking or twisting in the housing. This enables stable fluid film conditions to be maintained with consistently low friction values.

In contrast, conventional rubber and proofed fabric packings, when sealing satisfactorily, may cause an unacceptable level of friction. Moreover, the break out force required to start movement may be substantially greater than the running force required to sustain motion. Such erratic frictional values are undesirable on critical services where an exact and predictable response to applied pressure is required.

Our Lion Composite Seals are therefore highly recommended for services such as:

- AGC systems.
- Actuators.
- Servo-mechanisms.
- Weighing and measuring instruments.
- Hydraulic testing apparatus.
- Machine tools.
- Construction plant.

Lion Composite Seals have enabled the manufacturers and users of actuators to reduce the size of their cylinders, as they no longer need large diameter pistons to operate efficiently at low pressures.

Construction — standard

Sleeve/seal ring of Fluolion® G15 graphite-loaded PTFE, and a nitrile rubber (NBR) energizer. This combination is suitable for general petroleum-based hydraulic fluids at up to 200°F, including the kerosene-based fluids used in some AGC services.

Also, sleeve/sealing ring of high-performance Fluolion Xtreme PTFE, with a nitrile (NBR) or fluoroelastomer (FKM) energizing element.

Please consult our Technical Department if non-flammable fluids are used, as a different rubber type may be required.

Construction — non-standard

Other Fluolion PTFE grades are available, included 60 per cent bronze by weight. Alternative energizer materials, such as Viton® (FKM) and hydrogenated nitrile (HNBR) are available for use with higher temperatures or exotic fluids.

Design considerations

Tolerances: This range of seals is designed to suit cylinders conforming to ANSI B4.1 to tolerance class RC5.

Surface finish: To achieve optimum seal life, cylinders should have a honed finish to 8µin (0.2µm) Ra or CLA. Metal surfaces in static contact with the seal should be finished to 32µin (0.8m) Ra or CLA.

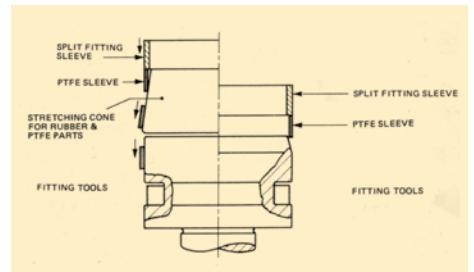

Fitting considerations

On a single piece, spool-type piston head, a cone should be used to pre-stretch both the energizer and the PTFE sleeve before assembly. This simplifies considerably the fitting of seal sizes below 2" (50mm) OD.

If a two-piece housing is NOT used for sizes below 1" (25mm), it is essential to have a fitting cone of reasonable length, with a minor diameter of approximately the same size as the root diameter of the housing groove.

It is strongly recommended that the PTFE sleeve be allowed to 'recover' for about three hours after stretching, before the piston assembly is fitted into the cylinder.

It is essential NOT to scratch or otherwise damage the PTFE sleeve. The energizer, and metal surfaces over which it passes, should be lightly lubricated prior to fitting.

Fitting tools

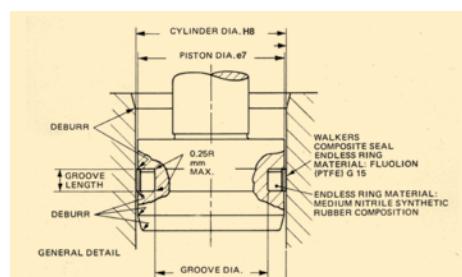

Lion® Composite Seals — for pistons & rods

Lion® Wiper Type L — for rods/rams

Robust wiper for heavy duty service in highly abrasive conditions

- Temperature range: -4°F to +250°F
- Supplied: Split or Endless
- Tough, rubberized fabric construction.
- Hardwearing for long working life.

Description

Lion® Wiper Type L rings are designed to limit severely the ingress of foreign matter into the seal housing on a wide variety of reciprocating hydraulic systems.

Manufactured in a versatile rubber-proofed fabric, these rings provide an effective wiping action while being tough and resilient to the wear encountered in such applications.

The wiping lip has a molded-in interference to ensure contact with the reciprocating ram at all times.

We recommend Lion Wiper Type L for heavy duty wiping operations on a wide range of reciprocating plant and equipment.

Construction — standard

Cotton fabric proofed with nitrile (NBR) rubber. This is suitable for service with most mineral-based hydraulic fluids, and most fire-resistant fluids of the water/oil emulsion or water/glycol types at temperatures up to 250°F. It also resists air, water, and most lubricating oils and greases.

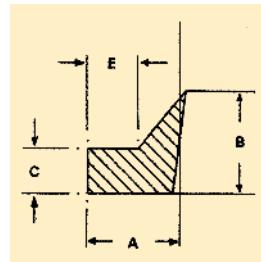

Construction — non-standard

Special materials extend considerably the temperature range and fluid compatibility.
Please contact our Technical Department.

Design considerations

These fabric wipers may be housed in various ways, depending on the designer's choice. Limits H8 from ANSI B4.1 RC5 apply to diameters D2 and D3.

Seal size diagram

How supplied

In split or endless form to any practical size.

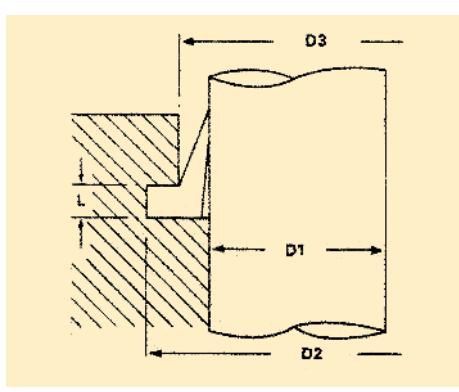

Ordering

Please state James Walker's product style, followed by ram size, stating inch or mm, and specify split or endless.
